

Two passions during my academic career have always been economics and games. Seeking a Master's in Applied Economics, I have become proficient in numerous types of data work. My personal dream is to be able to use the data analyzing skills I have developed in order to give back to the gaming industry that I have personally seen offer so much social connection to the people around me. Personal capacity to learn is evident, as I have approached data work through mediums such as SAS, R, and StatA to name a few. Coordination is a particular focus of mine. I effectively organized a group over the course of summer where we acted as consultants for AERG in conducting research into Florida programs. Having worked with data from both the private and public sectors in the past I am fluid in handling different types of data quickly and in an effective manner. I am sure that my skill sets in managing a consulting group can transfer over and be applicable to the Riot workplace. Furthermore, I have coding experience with R and Python on the data side, so coding will not be completely foreign to me in the Riot environment. My passion for the industry and ability to organize in an effective manner will help me push my workplace to excellence.
